- New Improved Premium Hard Coat Layer for scratch resistance.
- High Quality, Long Life, Multi-Purpose Film developed for better quality of life.

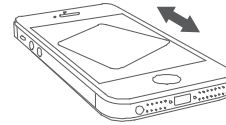

Features

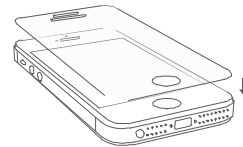

■ Installing the AF Film on your Screen ■

It is recommended that you turn off your device while installing or removing the AF Film on the screen

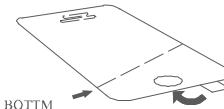

1. Use a soft cloth and thoroughly clean the surface of the screen. A clean screen will give the best results.

2. Position the AF Film on the screen and make sure it is in the right position.

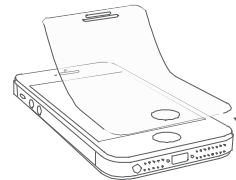

3. Pull back the BOTTOM LINER for about 1/3 the length as shown. Make sure nothing touches the adsorption side of the AF Film and the clean screen.

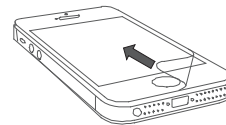

Remove the BOTTOM LINER film approximately to this line.

4. Match the position of the camera hole of the AF Film to the position of the camera lens and slowly remove the BOTTOM LINER from the AF Film.

5. After the AF Film is installed on the screen, remove the TOP LINER(GREEN).

*The AF Film will adhere to the screen correctly if the screen is clean and free from oil, dirt or dust.
 *If bubbles appear, use a soft cloth to push the bubbles out to the edges of the film.
 *If dirt is trapped between the film and the screen, use cellophane tape to lift the AF Film from the screen. Use another cellophane tape to remove dirt from adsorption side of the AF Film.
